Memo: Data Corruption Issues

Date: 11/8/2026
Memo To: Paul McIntyre, COO
From: Charles Thibault, Director Data Analytics
Subject: Possible Corruption of our "Likes" table

Introduction

We believe that the core table associating user Likes to social media Posts has been corrupted.

Background

The Performance Team sends weekly and monthly summaries of the business performance of the platform. The reports detail:

- *How many unique users Liked a Social Media Post*
- *How many Posts were Liked (that week or that month)*
    - *How many Likes came from pre-existing Posts*
    - *How many Likes came from New Posts, aka the New Post Velocity*

Furthermore, the Monetization teams directs Ads to Posts with the most Likes:

- *Our Monetization Platforms depend on Like data being correct*

Issue Detected

The Performance and Monetization teams correctly ask: "Which Users generate Posts that are Liked? Which Posts generate the most Likes?"

They did not ask: "Which Posts have <u>not yet</u> generated any Likes?"

By examining the data, we discovered that 13% of the Posts did not have any associated Likes:

- *Posts #14 and #15 did not have any Likes.*

Furthermore, when inspecting the database containing the Likes, we discovered that the data was sorted by Post_ID and that the table was truncated at 200 rows. We believe that this signals an incomplete data export.

Many data tools have default "number of rows" in a result set, and we believe that the data was corrupted as we updated our Oracle database instances.

Recommendation

The technology department needs to audit the recent data migration, as we believe it was corrupted.
